KIF2C (phospho Ser95) Monoclonal Antibody

Catalog No	BYmab-03038
Isotype	IgG
Reactivity	Human;Mouse
Applications	WB
Gene Name	KIF2C
Protein Name	Kinesin-like protein KIF2C
Immunogen	The antiserum was produced against synthesized peptide derived from human KIF2C around the phosphorylation site of Ser95. AA range:61-110
Specificity	Phospho-KIF2C (S95) Monoclonal Antibody detects endogenous levels of KIF2C protein only when phosphorylated at S95.
Formulation	Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.
Source	Monoclonal, Mouse,IgG
Purification	The antibody was affinity-purified from mouse antiserum by affinity-chromatography using epitope-specific immunogen.
Dilution	WB 1:500-2000
Concentration	1 mg/ml
Purity	≥90%
Storage Stability	-20°C/1 year
Synonyms	KIF2C; KNSL6; Kinesin-like protein KIF2C; Kinesin-like protein 6; Mitotic centromere-associated kinesin; MCAK
Observed Band	80kD
Cell Pathway	Cytoplasm, cytoskeleton . Nucleus . Chromosome, centromere . Chromosome, centromere, kinetochore . Associates with the microtubule network at the growing distal tip (the plus-end) of microtubules, probably through interaction with MTUS2/TIP150 and MAPRE1 (By similarity). Association with microtubule plus ends is also mediated by interaction with KIF18B. Centromeric localization requires the presence of BUB1 and SGO2. .
Tissue Specificity	Expressed at high levels in thymus and testis, at low levels in small intestine, the mucosal lining of colon, and placenta, and at very low levels in spleen and ovary; expression is not detected in prostate, peripheral blood Leukocytes, heart, brain, lung, liver, skeletal muscle, kidney or pancreas. Isoform 2 is testis-specific.
Function	function:Present throughout the cell cycle, associates with centromeres at early prophase, and remains associated with the centromere until after telophase.,PTM:Phosphorylated upon DNA damage, probably by ATM or ATR.,similarity:Belongs to the kinesin-like protein family.,similarity:Belongs to the

	kinesin-like protein family. MCAK/KIF2 subfamily.,similarity:Contains 1 kinesin-motor domain.,subunit:Interacts with CENPH.,tissue specificity:Expressed at high levels in thymus and testis, at low levels in small intestine, the mucosal lining of colon, and placenta, and at very low levels in spleen and ovary; expression is not detected in prostate, peripheral blood Leukocytes, heart, brain, lung, liver, skeletal muscle, kidney or pancreas.,
Background	kinesin family member 2C(KIF2C) Homo sapiens This gene encodes a kinesin-like protein that functions as a microtubule-dependent molecular motor. The encoded protein can depolymerize microtubules at the plus end, thereby promoting mitotic chromosome segregation. Alternative splicing results in multiple transcript variants. [provided by RefSeq, Jul 2014],
matters needing attention	Avoid repeated freezing and thawing!
Usage suggestions	This product can be used in immunological reaction related experiments. For more information, please consult technical personnel.
