Tissue Specificity	Highest expression in lung. Placenta, liver and heart also express high levels of GAIP.
Function	function:Inhibits signal transduction by increasing the GTPase activity of G protein alpha subunits thereby driving them into their inactive GDP-bound form. Binds to G-alpha subfamily 1 members, with the order G(i)a3 > G(i)a1 > G(o)a >> G(z)a/G(i)a2. Activity on G(z)-alpha is inhibited by phosphorylation and palmitoylation of the G-protein.,PTM:Fatty acylated. Heavily palmitoylated in the cysteine string motif.,PTM:Phosphorylated, mainly on serine residues.,similarity:Contains 1 RGS domain.,subunit:Interacts with GIPC PDZ domain.,tissue specificity:Highest expression in lung. Placenta, liver and heart also express high levels of GAIP.,
Background	G proteins mediate a number of cellular processes. The protein encoded by this gene belongs to the RGS (regulators of G-protein signaling) family and specifically

interacts with G protein, GAI3. This protein is a guanosine triphosphatase-activating protein that functions to down-regulate Galpha i/Galpha q-linked signaling. Alternatively spliced transcript variants encoding the same protein isoform have been found for this gene. [provided by RefSeq, Jul 2008],
