Function	developmental stage:Down-regulated in haemopoietic progenitor cells undergoing differentiation and hemoglobinization. Abundant in fetal liver.,function:Exports cytoplasmic heme. May be required to protect developing erythroid cells from heme toxicity. Causes susceptibility to FeLV-C in vitro.,similarity:Belongs to the major facilitator superfamily. Feline leukemia virus subgroup C receptor (TC 2.A.1.28.1) family.,tissue specificity:Found all hematopoietic tissues including peripheral blood lymphocytes. Some expression is found in pancreas and kidney.,
Background	This gene encodes a member of the major facilitator superfamily of transporter proteins. The encoded protein is a heme transporter that may play a critical role in erythropoiesis by protecting developing erythroid cells from heme toxicity. This gene may play a role in posterior column ataxia with retinitis pigmentosa and the
