Function	catalytic activity:An acylphosphate + H(2)O = a carboxylate + phosphate.,function:Its physiological role is not yet clear.,similarity:Belongs to the acylphosphatase family.,similarity:Contains 1 acylphosphatase-like domain.,
Background	Acylphosphatase can hydrolyze the phosphoenzyme intermediate of different membrane pumps, particularly the Ca ²⁺ /Mg ²⁺ -ATPase from sarcoplasmic reticulum of skeletal muscle. Two isoenzymes have been isolated, called muscle acylphosphatase and erythrocyte acylphosphatase on the basis of their tissue localization. This gene encodes the muscle-type isoform (MT). An increase of the MT isoform is associated with muscle differentiation. Several transcript variants encoding different isoforms have been found for this gene. [provided by RefSeq,
