

H2AW rabbit pAb

Catalog No	BYab-08642
Isotype	IgG
Reactivity	Human; Mouse
Applications	WB
Gene Name	H2AFY2 MACROH2A2
Protein Name	H2AW
Immunogen	Synthesized peptide derived from human H2AW AA range: 151-201
Specificity	This antibody detects endogenous levels of H2AW at Human/Mouse
Formulation	Liquid in PBS containing 50% glycerol, 0.5% BSA and 0.02% sodium azide.
Source	Polyclonal, Rabbit,IgG
Purification	The antibody was affinity-purified from rabbit serum by affinity-chromatography using specific immunogen.
Dilution	WB 1: 500-2000
Concentration	1 mg/ml
Purity	≥90%
Storage Stability	-20°C/1 year
Synonyms	
Observed Band	
Cell Pathway	Nucleus . Chromosome . Enriched in inactive X chromosome chromatin (PubMed:11331621, PubMed:11262398) and in senescence-associated heterochromatin (PubMed:15621527). .
Tissue Specificity	
Function	function:Variant histone H2A which replaces conventional H2A in a subset of nucleosomes where it represses transcription. Nucleosomes wrap and compact DNA into chromatin, limiting DNA accessibility to the cellular machineries which require DNA as a template. Histones thereby play a central role in transcription regulation, DNA repair, DNA replication and chromosomal stability. DNA accessibility is regulated via a complex set of post-translational modifications of histones, also called histone code, and nucleosome remodeling. May be involved in stable X chromosome inactivation.,similarity:Contains 1 histone H2A domain.,similarity:Contains 1 Macro domain.,subcellular location:Enriched in inactive X chromosome chromatin and in senescence-associated heterochromatin.,subunit:The nucleosome is a histone octamer containing two

Nanjing BYabscience technology Co.,Ltd

molecules each of H2A, H2B, H3 and H4 assembled in one H3-H4 heterotetramer

Background

Histones are basic nuclear proteins that are responsible for the nucleosome structure of the chromosomal fiber in eukaryotes. Nucleosomes consist of approximately 146 bp of DNA wrapped around a histone octamer composed of pairs of each of the four core histones (H2A, H2B, H3, and H4). The chromatin fiber is further compacted through the interaction of a linker histone, H1, with the DNA between the nucleosomes to form higher order chromatin structures. This gene encodes a replication-independent histone that is a member of the histone H2A family. It replaces conventional H2A histones in a subset of nucleosomes where it represses transcription and may participate in stable X chromosome inactivation. [provided by RefSeq, Oct 2015],
