Function	caution:It is uncertain whether Met-1 or Met-26 is the initiator.,disease:Defects in GORAB are the cause of geroderma osteodysplasticum (GO) [MIM:231070]; also known as geroderma osteodysplastica or Walt Disney dwarfism. GO is a rare autosomal recessive disorder characterized by lax, wrinkled skin, joint laxity and a typical face with a prematurely aged appearance. Skeletal signs include severe osteoporosis leading to frequent fractures, malar and mandibular hypoplasia and a variable degree of growth retardation.,similarity:Belongs to the GORAB family.,subunit:Interacts with SCYL1 (By similarity). Interacts with RCHY1 and RAB6A/RAB6.,

Background	golgin, RAB6 interacting(GORAB) Homo sapiens This gene encodes a member of the golgin family, a group of coiled-coil proteins localized to the Golgi. The encoded protein may function in the secretory pathway. The encoded protein, which also localizes to the cytoplasm, was identified by interactions with the N-terminal kinase-like protein, and thus it may function in mitosis. Mutations in this gene have been associated with geroderma osteodysplastica. Alternatively spliced transcript variants have been described. [provided by RefSeq, Mar 2009],
