

MeCP2 Monoclonal Antibody

Catalog No Isotype Reactivity Applications Gene Name Protein Name Immunogen Specificity Formulation Source Purification Dilution Concentration Purity	IgG Human WB MECP2 Methyl-CpG-binding protein 2 Synthetic Peptide of MeCP2 AA range: 313-363 The antibody detects endogenous MeCP2 proteins. PBS, pH 7.4, containing 0.5%BSA, 0.02% sodium azide as Preservative and 50% Glycerol. Monoclonal, Mouse,IgG The antibody was affinity-purified from mouse antiserum by affinity-chromatography using epitope-specific immunogen. WB 1:500-2000 1 mg/ml

Purification Dilution Concentration	The antibody was affinity-purified from mouse antiserum by affinity-chromatography using epitope-specific immunogen. WB 1:500-2000
Dilution Concentration	affinity-chromatography using epitope-specific immunogen. WB 1:500-2000
Concentration	
	1 mg/ml
Purity	
	≥90%
Storage Stability	-20°C/1 year
Synonyms	Methyl-CpG-binding protein 2 (MeCp-2 protein) (MeCp2)
Observed Band	53kD
Cell Pathway	Nucleus . Colocalized with methyl-CpG in the genome. Colocalized with TBL1X to the heterochromatin foci
Tissue Specificity	Present in all adult somatic tissues tested.
Function	disease:A chromosomal duplication involving MECP2 is the cause of mental retardation syndromic X-linked Lubs type (MRXSL) [MIM:300260]. Increased dosage of MECP2 appears to be responsible for the mental retardation phenotype. The main features present in affected males are severe to profound mental retardation with onset at birth, axial and facial hypotonia, progressive spasticity predominantly at the lower limbs, seizures and recurrent infections., disease:Defects in MECP2 are the cause of mental retardation syndromic X-linked type 13 (MRXS13) [MIM:300055]. Mental retardation is a

associated with other variable features such as spasticity, episodes of manic

Background

DNA methylation is the major modification of eukaryotic genomes and plays an essential role in mammalian development. Human proteins MECP2, MBD1, MBD2, MBD3, and MBD4 comprise a family of nuclear proteins related by the presence in each of a methyl-CpG binding domain (MBD). Each of these proteins, with the exception of MBD3, is caMABle of binding specifically to methylated DNA. MECP2, MBD1 and MBD2 can also repress transcription from methylated gene promoters. In contrast to other MBD family members, MECP2 is X-linked and subject to X inactivation. MECP2 is dispensible in stem cells, but is essential for embryonic development. MECP2 gene mutations are the cause of most cases of Rett syndrome, a progressive neurologic developmental disorder and one of the most common causes of mental retardation in females. Alternative splicing results in multiple transcript variants encoding different isofor
